Isabel Silva
Assignment 4: Apply the Seven Stages of Action and the Seven Fundamental Design Principles

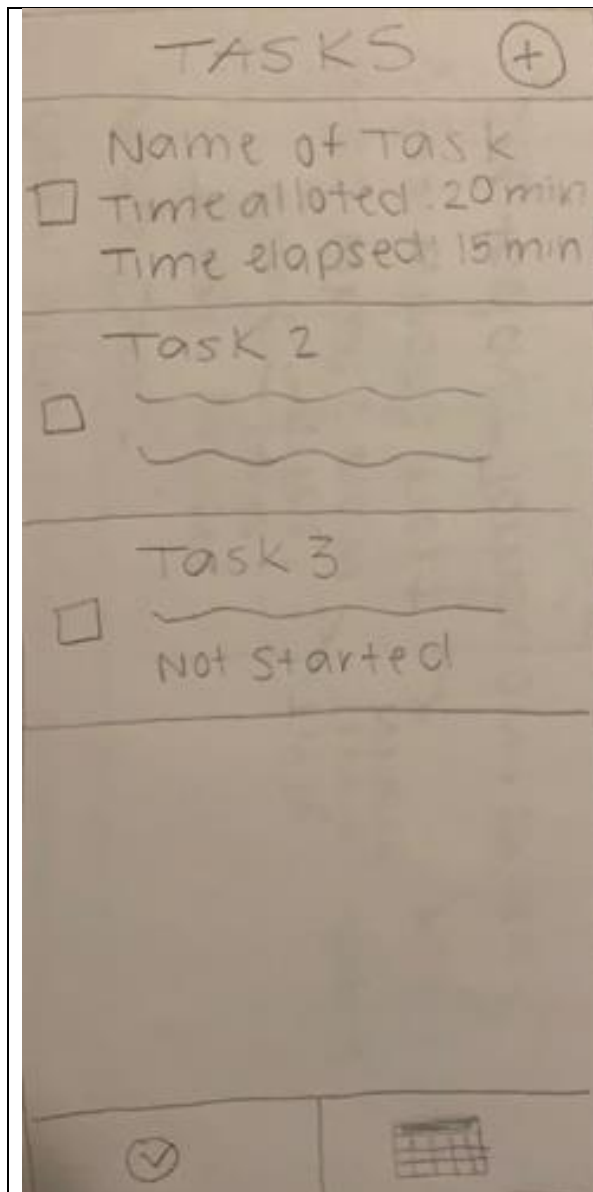

What is my "everyday action"? My app serves to help people schedule time to do the items in their to-do lists. It will allow them to import their calendar, create a to-do list with items that have estimated time for completion, schedule time to do those in their calendar, and track how long it takes them to complete the task.

This app allows Users to see all the tasks they have recorded as needing to be done. They can see what tasks they are currently working on and how long it has taken them, compared to their estimated time of completion. They can see what tasks they have not done and how much time they have estimated will take them to complete them. They can also see what tasks they have done and how long it took them to complete the task. They are also able to add tasks, focusing on the two most important features, what the task is and how long it will take them to accomplish the task. They can start and end tasks inside the app and be timed.

Scroll down for more info.

Tasks Page
- Allows Users to see all the tasks on their to-do list, how much time they have allotted to complete the task, and how long they have taken to complete the task if they have started it
- Allows Users to switch to the Calendar Screen
- Allows Users to Add a new Task

Add a Task
- Page where Users can add a Task
- Add the name of the task and the estimated time of completion
- Add the task to their to-do list
- Return to to-do list without adding the task

Calendar Page
- Allows Users to see their calendar and where the app has allotted time for them to complete a task on their to-do list
- Clicking the task allows Users to "Start" the task
- Users can toggle to different days
- Users can switch to the Tasks page

< TASK 1

20:00

Time started:

~~~~~~

STOP

Start Task
- Where Users can Start or Stop their tasks
- See how long they have been working on a Task and when they started the task
- Return to the previous page
